INDEX

SL.NO	PROGRAMS	PAGE NO
	COURSE OUTCOME 1	
1	Creating Objects of a Class	1
2	Matrix Addition	4
3	Add Complex numbers	7
4	Check symmetric matrix or not	10
5	Inner and Nested Class	14
	COURSE OUTCOME 2	
6	Sort Strings	16
7	Search an element in array	18
8	String Manipulation	20
9	Array of Objects	22
	COURSE OUTCOME 3	
10	Overloaded functions	25
11	Single Inheritance	28
12	Multilevel Inheritance	31
13	Print details of Book using Inheritance	35
14	Display academic details of student	37
15	Menu driven program to find area and perimeter	39
16	Bill Preparation	43
	COURSE OUTCOME 4	
17	Graphics Package	47
18	Arithmetic Package	51
19	Username and password authentication	54
20	Average of N Positive Integers	57
21	Generate multiplication table using thread	60
22	Fibonacci using runnable interface	63
23	Producer/Consumer Problem	66
24	Generic Stack	70
25	Bubble Sort	73
26	Array List	75
27	Remove elements from Linked list	79
28	Remove an object from stack	81
29	Creation of queue	83
30	Addition and Deletion in Dequeue	85

31	Creation of Set	90
32	Compare two hash set	92
33	Working of Map Interface	94
34	Convert Hash Map to Tree Map	96
	COURSE OUTCOME 5	
35	Draw shapes in Applet	98
36	Find maximum using AWT	100
37	Display a happy face /sad face according to percentage	104
38	Mouse Events	108
39	Simple Calculator using AWT	111
40	Choice Components with shapes	116
41	Handling mouse events and window events	119
42	Handling Key Events	124
	COURSE OUTCOME 6	
43	Listing Sub directories and files	126
44	Read and Display File	128
45	Copy one file to another	130
46	Copy Even and Odd numbers to Separate Files	132
47	TCP socket programming	135
48	UDP socket programming	138

PROGRAM NO : 1

AIM: Define a class 'product' with data members pcode, pname and price. Create 3 objects of the class and find the product having the lowest price.

ALGORITHM:

Step 1: Start.

Step 2: Define a class having name Product and members as pcode,pname and price.

Step 3: Declare three objects in the class and add the values of each data members into objects.

Step 4: Using if condition check which object has the lowest price and print it.

Step 5: Stop.

PROGRAM CODE:

Main.java	<pre> import java.util.Scanner; public class Main { public static void main(String[] args) { //Driver program Scanner scan = new Scanner(System.in); Product[] products = new Product[3]; for(int i=0;i<3;i++) { int count = i+1; products[i] = new Product(); System.out.print("Enter product "+count+" name : "); products[i].pname = scan.nextLine(); System.out.print("Enter product "+count+" code : "); products[i].pcode = scan.nextLine(); System.out.print("Enter product "+count+" price : "); products[i].price = Integer.parseInt(scan.nextLine()); </pre>
-----------	--

```

    }

    scan.close();

    if(products[0].price< products[1].price && products[0].price<
products[2].price) {
        System.out.println("The product with lowest price is:" +
products[0].pname);
    }
    if(products[1].price<products[0].price &&
products[1].price<products[2].price) {
        System.out.println("The product with lowest price
is:"+products[1].pname);
    }
    if(products[2].price<products[0].price &&
products[2].price<products[1].price) {
        System.out.println("The product with lowest price
is:"+products[2].pname);
    }

    }
}
package com.lab_cycles.co1.q1;

import java.util.Scanner;

public class Main {

    public static void main(String[] args) {
        //Driver program

        Scanner scan = new Scanner(System.in);
        Product[] products = new Product[3];

        for(int i=0;i<3;i++)
        {
            int count = i+1;

            products[i] = new Product();
            System.out.print("Enter product "+count+" name : ");
            products[i].pname = scan.nextLine();

            System.out.print("Enter product "+count+" code : ");
            products[i].pcode = scan.nextLine();

```

	<pre> System.out.print("Enter product "+count+" price : "); products[i].price = Integer.parseInt(scan.nextLine()); } scan.close(); if(products[0].price< products[1].price && products[0].price< products[2].price) { System.out.println("The product with lowest price is:"+ products[0].pname); } if(products[1].price<products[0].price && products[1].price<products[2].price) { System.out.println("The product with lowest price is:"+products[1].pname); } if(products[2].price<products[0].price && products[2].price<products[1].price) { System.out.println("The product with lowest price is:"+products[2].pname); } } } </pre>
Product.java	<pre> public class Product { public String pcode; public String pname; public int price; } </pre>

RESULT: The above program is executed and obtained the output.

OUTPUT:

```

Run: Main (1) x
C:\Users\Razik\.jdk\corretto-1.8.0_292\bin\java.exe ...
Enter product 1 name : Jam
Enter product 1 code : j
Enter product 1 price : 70
Enter product 2 name : Butter
Enter product 2 code : b
Enter product 2 price : 150
Enter product 3 name : Bread
Enter product 3 code : b
Enter product 3 price : 40
The product with lowest price is:Bread
Process finished with exit code 0

```

PROGRAM NO : 2

AIM: Read 2 matrices from the console and perform matrix addition.

ALGORITHM :

Step 1: Start.

Step 2: Define a class having name AddMatrix.

Step 3: Read row number(m),column number (n) and initialize the double dimensional arrays mat1[],mat2[],res[] with same row number ,column number.

Step 4: Store the first matrix elements into the two-dimensional array matrix mat1[][] using two for loops. i indicates row number, j indicates column index. Similarly second matrix elements in to mat2[][].

Step 5: Add the two matrices using for loop.

for i=0 to i<m

for j=0 to j<n

mat1[i][j] + mat2[i][j] and store it in to the matrix res[i][j] .

Step 6: Print sum of matrices res[i][j].

Stop 7: Stop.

PROGRAM CODE:

AddMatrix .java	<pre> import java.util.Scanner; public class AddMatrix { public static void main(String args[]) { int row, col,i,j; Scanner in = new Scanner(System.in); System.out.println("Enter the number of rows : "); row = in.nextInt(); System.out.println("Enter the number columns : "); col = in.nextInt(); int mat1[][] = new int[row][col]; </pre>
--------------------	--

```
int mat2[][] = new int[row][col];
int res[][] = new int[row][col];

System.out.println("Enter the elements of matrix 1 : ");

for ( i= 0 ; i < row ; i++ )
{
    for ( j= 0 ; j < col ;j++ )
        mat1[i][j] = in.nextInt();

    System.out.println();
}
System.out.println("Enter the elements of matrix 2 : ");

for ( i= 0 ; i < row ; i++ )
{
    for ( j= 0 ; j < col ;j++ )
        mat2[i][j] = in.nextInt();

    System.out.println();
}

for ( i= 0 ; i < row ; i++ )
    for ( j= 0 ; j < col ;j++ )
        res[i][j] = mat1[i][j] + mat2[i][j] ;

System.out.println("Sum of matrices : ");

for ( i= 0 ; i < row ; i++ )
{
    for ( j= 0 ; j < col ;j++ )
        System.out.print(res[i][j]+"\\t");

    System.out.println();
}

}
```

RESULT: The above program is executed and obtained the output.

OUTPUT:

The screenshot shows a Java IDE console window titled 'Run: AddMatrix x'. The console output is as follows:

```
6
7
8
9
Enter the elements of matrix 2 :
1
3
5
7
9
11
13
15
17
Sum of matrices :
2 5 8
11 14 17
20 23 26
Process finished with exit code 0
```

PROGRAM NO : 3

AIM: Add complex numbers.

ALGORITHM:

Step 1: Start.

Step 2: Define a class having name ComplexNumber and data members are real and imaginary number.

Step 3: Define a function ComplexNumber and add values to variables.

Step 4 : Define a function ComplexNumber sum to add complex number using 3rd ComplexNumber object and return the value.

Step 5: Print the sum value.

Step 6: Stop.

PROGRAM CODE:

ComplexNumber.java	<pre> public class ComplexNumber { double real,imaginary; ComplexNumber(double real,double imaginary) { this.real = real; this.imaginary = imaginary; } ComplexNumber addComplexNumber(ComplexNumber complexNumber1,ComplexNumber complexNumber2) { double real = complexNumber1.real+ complexNumber2.real; </pre>
--------------------	---

	<pre> double imaginary = complexNumber1.imaginary+complexNumber2.imaginary; ComplexNumber complexNumber = new ComplexNumber(real,imaginary); return complexNumber; } String displayComplexNumber() { return this.real+" + "+this.imaginary+"i"; } } </pre>
Main.java	<pre> public class Main { public static void main(String[] args) { ComplexNumber complexNumber1 = new ComplexNumber(3,5); ComplexNumber complexNumber2 = new ComplexNumber(10,4.5); ComplexNumber complexNumber3 = new ComplexNumber(0,0); complexNumber3 = complexNumber3.addComplexNumber(complexNumber1,complexNumbe r2); System.out.println("(" +complexNumber1.displayComplexNumber()+") + ("+complexNumber2.displayComplexNumber()+") = "+complexNumber3.displayComplexNumber()); } } </pre>

RESULT: The above program is executed and obtained the output.

OUTPUT:

```
Run: Main (2) ×
C:\Users\Razik\.jdk\corretto-1.8.0_292\bin\java.exe ...
(3.0 + 5.0i) + (10.0 + 4.5i) = 13.0 + 9.5i
Process finished with exit code 0
```

PROGRAM NO : 4

AIM: Read a matrix from the console and check whether it is symmetric or not.

ALGORITHM:

Step 1: Start.

Step 2 : Read row number,column number and initialize the double dimensional array with same row number ,column number.

Step 3 : Store the first matrix elements into the two-dimensional array matrix using two for loops. i indicates row number, j indicates column index.

Step 4: Check whether the matrix is symmetric or not.

Step 5: Print the symmetric matrix or if not.

Step 6: Stop.

PROGRAM CODE:

Main.java	<pre>import java.util.Scanner; public class Main { public static void main(String[] args) { Scanner sc = new Scanner(System.in); System.out.println("Enter the no. of rows : "); int rows = sc.nextInt(); System.out.println("Enter the no. of columns : ")</pre>
-----------	---

```
int cols = sc.nextInt();

int matrix[][] = new int[rows][cols];

System.out.println("Enter the elements :");

for (int i = 0; i < rows; i++)

{

    for (int j = 0; j < cols; j++)

    {

        System.out.println("Input number for matrix position  
["+(i+1)+"]["+(j+1)+"] : ");

        matrix[i][j] = sc.nextInt();

    }

}

System.out.println("Printing the input matrix :");

for (int i = 0; i < rows; i++)

{

    for (int j = 0; j < cols; j++)

    {

        System.out.print(matrix[i][j]+"\\t");

    }

    System.out.println();

}
```

```
//Checking the input matrix for symmetric

if(rows != cols)

{

    System.out.println("The given matrix is not a square matrix, so it
can't be symmetric.");

}

else

The given matrix is symmetric...  
Process finished with exit code 0
```

PROGRAM NO : 5

AIM: Create CPU with attribute price. Create inner class Processor (no. of cores, manufacturer) and static nested class RAM (memory, manufacturer). Create an object of CPU and print information of Processor and RAM.

ALGORITHM :

Step 1: Start.

Step 2: Define a class cpu with data member price and class processor.

Step 3: Class processor contain data members no_cores,manufacturer and a nested class RAM.

Step 4: class RAM contain memory and manufacturer as data members.

Step 5: Create objects in corresponding classes and display it's details.

Step 6: Stop.

PROGRAM CODE:

CPU.java	<pre> public class CPU { int price; Processor processor = new Processor(); RAM ram = new RAM(); static class Processor { int cores; String manufacturer; } static class RAM { int memory; String manufacturer; } </pre>
----------	--

	<pre> CPU(int cpuPrice,int cores,String cpuManufacturer,int memory,String ramManufacturer){ this.price = cpuPrice; this.processor.cores = cores; this.processor.manufacturer = cpuManufacturer; this.ram.memory = memory; this.ram.manufacturer = ramManufacturer; } void printCPUSpecifications() { System.out.println("CPU Specifications"); System.out.println("-----"); System.out.println("CPU price : "+this.price); System.out.println("Processor cores : "+this.processor.cores); System.out.println("Processor manufacturer : "+this.processor.manufacturer); System.out.println("RAM memory : "+this.ram.memory); System.out.println("RAM manufacturer : "+this.ram.manufacturer); System.out.println("-----"); } } </pre>
Main.java	<pre> public class Main { public static void main(String[] args) { CPU cpu1 = new CPU(50000, 8, "INTEL", 8000, "ADATA"); cpu1.printCPUSpecifications(); } } </pre>

RESULT: The above program is executed and obtained the output.

OUTPUT:

```

Run: Main x
C:\Users\Razik\.jdk\corretto-1.8.0_292\bin\jav
CPU Specifications
-----
CPU price : 50000
Processor cores : 8
Processor manufacturer : INTEL
RAM memory : 8000
RAM manufacturer : ADATA
-----

Process finished with exit code 0

```

PROGRAM NO : 6

AIM: Program to Sort strings.

ALGORITHM :

Step 1: Start

Step 2: Select the first element of the list (i.e., Element at first position in the list).

Step 3: Compare the selected element with all the other elements in the list.

Step 4: In every comparison, if any element is found smaller than the selected element (for Ascending order), then both are swapped.

Step 5: Repeat the same procedure with element in the next position in the list till the entire list is sorted.

Step 6: Stop

PROGRAM CODE:

Sort.java	<pre>import java.util.Scanner; public class Sort { public static void main(String[] args) { int count; String temp; Scanner scan = new Scanner(System.in); //User will be asked to enter the count of strings System.out.print("Enter number of strings you would like to enter: "); count = scan.nextInt(); String[] str = new String[count]; Scanner scan2 = new Scanner(System.in);</pre>
-----------	---

```

//User is entering the strings and they are stored in an array
System.out.println("Enter the Strings one by one: ");
for(int i = 0; i < count; i++)
{
    str[i] = scan2.nextLine();
}
scan.close();
scan2.close();

//Sorting the strings
for (int i = 0; i < count; i++)
{
    for (int j = i + 1; j < count; j++) {
        if (str[i].compareTo(str[j])>0)
        {
            temp = str[i];
            str[i] = str[j];
            str[j] = temp;
        }
    }
}

//Displaying the strings after sorting them based on alphabetical order
System.out.print("Strings in Sorted Order: ");
for (int i = 0; i <= count - 1; i++)
{
    System.out.print(str[i] + ", ");
}

}
}

```

RESULT: The above program is executed and obtained the output.

OUTPUT:

```

Run: Sort x
C:\Users\Razik\.jdk\corretto-1.8.0_302\bin\java.exe ...
Enter number of strings you would like to enter: 5
Enter the Strings one by one:
Brazil
Argentina
Germany
France
England
Strings in Sorted Order: Argentina, Brazil, England, France, Germany,
Process finished with exit code 0

```

PROGRAM NO : 7

AIM: Search an element in an array.

ALGORITHM :

Step 1: Start

Step 2: Check each element in the given list with the string provided by the user.

Step 3: If string is found, display the position of the string found, else display string not found.

Step : Stop

PROGRAM CODE:

SearchItem.java	<pre> import java.util.Scanner; public class SearchItem { public static void main(String[] args) { int count; String temp; Scanner scan = new Scanner(System.in); Scanner scan2 = new Scanner(System.in); Scanner scan3 = new Scanner(System.in); //User will be asked to enter the count of strings System.out.print("Enter number of strings you would like to enter: "); count = scan.nextInt(); String[] str = new String[count]; //User is entering the strings and they are stored in an array System.out.println("Enter the Strings one by one: "); for(int i = 0; i < count; i++) { str[i] = scan2.nextLine(); } System.out.println("Enter the String to be searched : "); </pre>
-----------------	---

	<pre> String searchString = scan3.nextLine(); for (int i = 0; i < count; i++) { if(str[i].equals(searchString)){ System.out.println("The required string is in position : "+(i)); System.exit(0); } } scan.close(); scan2.close(); scan3.close(); System.out.println("Could not find required string in Array."); } } </pre>
--	--

RESULT: The above program is executed and obtained the output.

OUTPUT:

```

Run: SearchItem x
C:\Users\Razik\.jdk\corretto-1.8.0_302\bin\java.exe ...
Enter number of strings you would like to enter: 8
Enter the Strings one by one:
Blue
Red
Green
Purple
Violet
Orange
Grey
Gold
Enter the String to be searched :
Violet
The required string is in position : 4
Process finished with exit code 0

```

PROGRAM NO : 8**AIM:** Perform string manipulations**ALGORITHM :**

Step 1: Start

Step 2: Take the strings provided by the user and concatenate them.

Step 3: Display the combined string with lower case.

Step 3: Display the combined string with upper case.

Step 4: Display the combined string after replacing all the 's' & 'S' characters with '\$' character.

Step 5: Stop

PROGRAM CODE:

StringMan.java	<pre> import java.util.Scanner; public class SearchItem { public static void main(String[] args) { int count; String temp; Scanner scan = new Scanner(System.in); Scanner scan2 = new Scanner(System.in); Scanner scan3 = new Scanner(System.in); //User will be asked to enter the count of strings System.out.print("Enter number of strings you would like to enter: "); count = scan.nextInt(); String[] str = new String[count]; //User is entering the strings and they are stored in an array System.out.println("Enter the Strings one by one: "); for(int i = 0; i < count; i++) { </pre>
----------------	---

	<pre> str[i] = scan2.nextLine(); } System.out.println("Enter the String to be searched : "); String searchString = scan3.nextLine(); for (int i = 0; i < count; i++) { if(str[i].equals(searchString)){ System.out.println("The required string is in position : "+(i)); System.exit(0); } } scan.close(); scan2.close(); scan3.close(); System.out.println("Could not find required string in Array."); } } </pre>
--	--

RESULT: The above program is executed and obtained the output.

OUTPUT:

```

Run: StringMan x
C:\Users\Razik\.jdk\corretto-1.8.0_302\bin\java.exe .
Enter 2 words and atleast one of them contain a 's' :
Success
Pays
Convert to LowerCase: success pays
Convert to UpperCase: SUCCESS PAYS
$UCCE$$ PAY$

Process finished with exit code 0

```

PROGRAM NO : 9

AIM: Program to create a class for Employee having attributes eNo, eName eSalary. Read n employ information and Search for an employee given eNo, using the concept of Array of Objects.

ALGORITHM :

Step 1: Start

Step 2: Search the 'eNo' attribute of the list of Employee Objects for the 'eNo' provided by the user.

Step 3: If user provided 'eNo' is found inside the Employee object list, display the details of the corresponding employee.

Step 4: Stop

PROGRAM CODE:

Employee.java	<pre> public class Employee { public String eNo; public String eName; public int eSalary; public Employee(String eNo,String eName,int eSalary) { this.eNo = eNo; this.eName = eName; this.eSalary = eSalary; } } </pre>
Main.java	<pre> import java.util.Scanner; public class Main { public static void main(String[] args) { </pre>

```

Scanner scan = new Scanner(System.in);

System.out.print("Enter count of employee list : ");
int count = Integer.parseInt(scan.nextLine());

Employee[] employees = new Employee[count];

for (int i=0;i<count;i++)
{
    System.out.print("Enter Number of employee : ");
    String eNo = scan.nextLine();
    System.out.print("Enter Name of employee : ");
    String eName = scan.nextLine();
    System.out.print("Enter Salary of employee : ");
    int eSalary = Integer.parseInt(scan.nextLine());
    employees[i] = new Employee(eNo,eName,eSalary);
}

System.out.print("Enter the number of employee to be filtered out :
");
String search = scan.nextLine();

for (int i=0;i<count;i++){

    if(employees[i].eNo.equals(search))
    {
        System.out.println("Employee Number : "+employees[i].eNo);
        System.out.println("Employee Name : "+employees[i].eName);
        System.out.println("Employee Salary : "+employees[i].eSalary);
    }

}

}

```

RESULT: The above program is executed and obtained the output.

OUTPUT:

The screenshot shows a Java IDE console window titled "Run: Main (1) x". The console displays the execution of a Java program. The first line shows the command: `C:\Users\Razik\.jdk\corretto-1.8.0_302\bin\java.exe ...`. The program prompts the user to enter the count of employee list, which is 3. It then prompts for the number of employee, which is 4532. Next, it prompts for the name of employee, which is Jazi, and the salary, which is 90000. It then prompts for the number of employee, which is 2342, and the name, which is Jacinda, and the salary, which is 100000. It then prompts for the number of employee, which is 7621, and the name, which is Blanc, and the salary, which is 60000. Finally, it prompts for the number of employee to be filtered out, which is 7621. The program then displays the details of the employee with number 7621: Employee Number : 7621, Employee Name : Blanc, and Employee Salary : 60000. The program finishes with exit code 0.

```
Run: Main (1) x
C:\Users\Razik\.jdk\corretto-1.8.0_302\bin\java.exe ...
Enter count of employee list : 3
Enter Number of employee : 4532
Enter Name of employee : Jazi
Enter Salary of employee : 90000
Enter Number of employee : 2342
Enter Name of employee : Jacinda
Enter Salary of employee : 100000
Enter Number of employee : 7621
Enter Name of employee : Blanc
Enter Salary of employee : 60000
Enter the number of employee to be filtered out : 7621
Employee Number : 7621
Employee Name : Blanc
Employee Salary : 60000

Process finished with exit code 0

PROGRAM NO : 10

AIM: Area of different shapes using overloaded functions.

ALGORITHM :

Step 1: Start

Step 2: Define the main class

Step 3: Define methods with the same methodname that performs the area operation for each shape

Step 4: Display the areas of each shapes.

PROGRAM CODE:

Areas.java	<pre> public class Areas { public void area(float length,float breadth) { System.out.println("Area of reactangle is: "+length*breadth); } public void area(float radius) { System.out.println("Area of circle is: "+(radius*radius*Math.PI)); } public void area(float length,float breadth, float height) { float area = 2*((length*breadth)+(breadth*height)+(length*height)); System.out.println("Area of cuboid is: "+area); } } </pre>
Overloaded.java	<pre> import java.util.Scanner; public class Overloaded { public static void main(String[] args) { float a,b,c; int choice; Scanner scanner=new Scanner(System.in); </pre>

```
Areas areas = new Areas();

System.out.println("Enter the surface area to be calculated : ");
System.out.println("1.Circle");
System.out.println("2.Rectangle");
System.out.println("3.Cuboid");
choice = scanner.nextInt();

if(choice==1)
{
    System.out.println("Enter the radius of the circle: ");
    a=scanner.nextInt();
    areas.area(a);
}
else if(choice==2)
{
    System.out.println("Enter the length of the rectangle: ");
    a=scanner.nextInt();
    System.out.println("Enter the breadth of the rectangle: ");
    b=scanner.nextInt();
    areas.area(a,b);
}
else if(choice==3)
{
    System.out.println("Enter the length of the cuboid: ");
    a=scanner.nextInt();
    System.out.println("Enter the breadth of the cuboid: ");
    b=scanner.nextInt();
    System.out.println("Enter the height of the cuboid: ");
    c=scanner.nextInt();
    areas.area(a,b,c);
}
else
{
    System.out.println("Invalid Choice");
}
}
```

RESULT: The above program is executed and obtained the output.

OUTPUT:

Run: Overloaded x

```
C:\Users\Razik\.jdk\corretto-1.8.0_302\bin\java.exe ...  
Enter the surface area to be calculated :  
1.Circle  
2.Rectangle

PROGRAM NO : 11

AIM: Create a class ‘Employee’ with data members Empid, Name, Salary, Address and constructors to initialize the data members. Create another class ‘Teacher’ that inherit the properties of class employee and contain its own data members department, Subjects taught and constructors to initialize these data members and also include display function to display all the data members. Use array of objects to display details of N teachers.

ALGORITHM :

Step 1: Start

Step 2: create class “employee” with the provided data members and define the constructors

Step 3: create another class “Teachers” that performs inheritance of employee class and define constructors for the same

Step 4: create an array of objects in the corresponding class

Step 5: Display the details for the number of teachers provided.

PROGRAM CODE:

Employee.java a	<pre> public class Employee { String Empid; String Name; String Salary; String Address; Employee(String Empid,String Name,String Salary,String Address) { this.Empid = Empid; this.Name = Name; this.Salary = Salary; this.Address = Address; } } </pre>
Teacher.java	<pre> public class Teacher extends Employee { String department; String Subjects; </pre>

	<pre> Teacher(String Empid, String Name, String Salary, String Address,String department,String Subjects) { super(Empid, Name, Salary, Address); this.department = department; this.Subjects = Subjects; } void displayTeacherDetails() { System.out.println("Empid : "+this.Empid+" Name : "+this.Name+" Salary : "+this.Salary+" Address : "+this.Address+"department : "+this.department+" Subjects : "+this.Subjects); } } </pre>
Main.java	<pre> import java.util.Scanner; public class Main { public static void main(String[] args) { int count; Scanner scanner = new Scanner(System.in); System.out.print("Input the number of teachers required : "); count = scanner.nextInt(); Teacher[] teachers = new Teacher[count]; for(int i=0;i<count;i++) { int j = i+1; System.out.print("Enter Empid of teacher "+j+" : "); String Empid = scanner.next(); System.out.print("Enter Name of teacher "+j+" : "); String Name = scanner.next(); System.out.print("Enter Salary of teacher "+j+" : "); String Salary = scanner.next(); System.out.print("Enter Address of teacher "+j+" : "); String Address = scanner.next(); System.out.print("Enter department of teacher "+j+" : "); String department = scanner.next(); System.out.print("Enter Subjects of teacher "+j+" : "); String Subjects = scanner.next(); teachers[i] = new Teacher(Empid, Name, Salary, Address, department, Subjects); } } } </pre>

```

        System.out.println("\n-----\n");
        System.out.println("Teacher's List \n");

        for(int i=0;i<count;i++) {
            teachers[i].displayTeacherDetails();
        }
    }
}

```

RESULT: The above program is executed and obtained the output.

OUTPUT:

```

Run: Main (4) x

PROGRAM NO : 18

AIM: Create an Arithmetic package that has classes and interfaces for the 4 basic arithmetic operations. Test the package by implementing all operations on two given numbers.

ALGORITHM :

Step 1: Start

Step 2: To create a package named arithmetic, create a folder of the same name in the directory. Here inside that we have another module named operation

Step 3: Inside arithmetic package, create modules to perform addition, subtraction, multiplication and division of 2 numbers.

Step 4: Outside the folder, write another program that access the above module and print the output.

Step 5: Stop

PROGRAM CODE:

Arithmetic/ AdditionOperation.java	<pre>public class AdditionOperation implements ArithmeticOperation { public int operateNumbers(int number1,int number2) { return number1+number2; } }</pre>
Arithmetic/ ArithmeticOperation.java	<pre>public interface ArithmeticOperation { public int operateNumbers(int number1,int number2); }</pre>
Arithmetic/ DivisionOperator.java	<pre>public class DivisionOperator implements ArithmeticOperation{ public int operateNumbers(int number1,int number2) {</pre>

	<pre> return number1*number2; } } </pre>
Arithmetic/ MultiplicationOperator.java	<pre> public class MultiplicationOperator implements ArithmeticOperation{ public int operateNumbers(int number1,int number2) { return number1*number2; } } </pre>
Arithmetic/ SubtractionOperation.java	<pre> public class SubtractionOperation implements ArithmeticOperation{ public int operateNumbers(int number1,int number2) { return number1-number2; } } </pre>
Main.java	<pre> import com.lab_cycles.co4.q2.Arithmetic.AdditionOperation; import com.lab_cycles.co4.q2.Arithmetic.DivisionOperator; import com.lab_cycles.co4.q2.Arithmetic.MultiplicationOperator; import com.lab_cycles.co4.q2.Arithmetic.SubtractionOperation; import java.util.Scanner; public class Main { public static void main(String[] args) { Scanner scanner = new Scanner(System.in); System.out.println("Choose an operation : 1.Add, 2.Subtract, 3.Multiply, 4.Divide"); int choice = scanner.nextInt(); System.out.println("Enter the numbers : "); int number1 = scanner.nextInt(); int number2= scanner.nextInt(); System.out.println("The Result is : 3"); switch (choice){ </pre>

```

        case 1:
            AdditionOperation additionOperation = new
AdditionOperation();

System.out.println(additionOperation.operateNumbers(number1,number2)
);

            break;
        case 2:
            SubtractionOperation subtractionOperation = new
SubtractionOperation();

System.out.println(subtractionOperation.operateNumbers(number1,numbe
r2));

            break;
        case 3:
            MultiplicationOperator multiplicationOperator = new
MultiplicationOperator();

System.out.println(multiplicationOperator.operateNumbers(number1,numb
er2));

            break;
        case 4:
            DivisionOperator divisionOperator = new DivisionOperator();

System.out.println(divisionOperator.operateNumbers(number1,number2));

            break;
        default:
            System.out.println("Invalid Code");
    }

}

}

```

RESULT: The above program is executed and obtained the output.

OUTPUT:

```

PROGRAM NO : 19

AIM: Write a user defined exception class to authenticate the user name and password.

ALGORITHM :

Step 1: Start

Step 2: Create a class named usernameex that inherits Exception class with a constructor that calls Exception class constructor and pass error message.

Step 3: Create a class named passwordex that inherits Exception class with a constructor that calls Exception class constructor and pass error message.

Step 4: Inside the main(), Read the username and password.

Step 5: Inside the try block, we throw usernameex and passwordex with appropriate message if any of the condition is true:

- If username is empty
- If password is empty
- If password doesn't contain special characters
- If username length is less than 6
- If password is not strong enough

Step 6: Inside the catch block with parameter usernameex's object, print "USERNAME EXCEPTION OCCURED"

Step 7: Inside the catch block with parameter passwordex's object, print "PASSWORD EXCEPTION OCCURED"

Step 8: Stop

PROGRAM CODE:

UserException.java	<pre>public class UserException extends Exception { public UserException(String s) { // Call constructor of parent Exception super(s); } }</pre>
--------------------	---

	}
Main.java	<pre> import java.util.Scanner; public class Main { public static void main(String args[]) { Scanner scanner = new Scanner(System.in); String username,password; try { System.out.println("Please enter a username : "); username = scanner.nextLine(); if(username.equals("")){ throw new UserException("Username not provided !"); } if(username.length()<8){ throw new UserException("The username should be atleast 8 characters long !"); } System.out.println("Please enter a password : "); password = scanner.nextLine(); if(password.equals("")){ throw new UserException("Password not provided !"); } if(password.length()<6){ throw new UserException("The password should be atleast 6 characters long !"); } System.out.println("User Data Accepted"); } catch (UserException ex) { System.out.println("Caught"); </pre>

	<pre> System.out.println(ex.getMessage()); } }</pre>

PROGRAM NO : 22

AIM: Define 2 classes; one for generating Fibonacci numbers and other for displaying even numbers in a given range. Implement using threads. (Runnable Interface).

ALGORITHM :

Step 1: Start

Step 2: Create a class named even that implements Runnable interface with function run()

Step 3: Inside run(), we read the limit for printing even numbers and print it using for loop. Step 4: Create another class fib that implements Runnable interface with function run().

Step 5: Inside run(), Initialise n1 as 0, n2 as 1 and n3 as 0.

Step 6: Check if n<0, if true, print "Enter a positive number" else go to step 7

Step 7: Repeat step 8 to 11 until n3>n

Step 8: Print n1

Step 9: n3=n1+n2

Step 10: n1=n2

Step 11: n2=n3

Step 12: Create object e of even and create an object t1 of Thread with its parameterized constructor passing e as parameter

Step 13: Call start() using t1

Step 14: Do the same for class odd with Thread object t2 and call start() using t2

Step 15: Stop

PROGRAM CODE:

EvenSeries.java	<pre>public class EvenSeries implements Runnable { int count; int[] fibonacciSeries;</pre>
-----------------	---

	<pre> EvenSeries(int count){this.count=count;} public void run() { for (int i=0;i<count;i++) { if(i%2==0) { System.out.println("Even Number : "+i); } } } } </pre>

```

PROGRAM NO : 23

AIM: Producer/Consumer using ITC

ALGORITHM :

Step 1:Start

Step 2:In PC class (A class that has both produce and consume methods), a linked list of jobs and a capacity of the list is added to check that producer does not produce if the list is full.

Step 3:In Producer class, the value is initialized as 0.

Step 4:We have an infinite outer loop to insert values in the list. Inside this loop, we have a synchronized block so that only a producer or a consumer thread runs at a time. An inner loop is there before adding the jobs to list that checks if the job list is full, the producer thread gives up the intrinsic lock on PC and goes on the waiting state.

Step 5:If the list is empty, the control passes to below the loop and it adds a value in the list.

Step 6:In the Consumer class, we again have an infinite loop to extract a value from the list. Inside, we also have an inner loop which checks if the list is empty.

Step 7:If it is empty then we make the consumer thread give up the lock on PC and passes the control to producer thread for producing more jobs.

Step 8:If the list is not empty, we go round the loop and removes an item from the list.

Step 9:In both the methods, we use notify at the end of all statements. The reason is simple, once you have something in list, you can have the consumer thread consume it, or if you have consumed something, you can have the producer produce something.

Step 10:sleep() at the end of both methods just make the output of program run in step wise manner and not display everything all at once so that you can see what actually is happening in the program.

Step 11:Stop.

PROGRAM CODE:

Main.java	<pre>import java.util.LinkedList; public class Main { public static void main(String[] args) throws InterruptedException { final PC pc = new PC(); Thread t1 = new Thread(new Runnable() { @Override public void run() { try { pc.produce(); } catch (InterruptedException e) { e.printStackTrace(); } } }); Thread t2 = new Thread(new Runnable() { @Override public void run() { try { pc.consume(); } catch (InterruptedException e) { e.printStackTrace(); } } }); t1.start(); t2.start(); t1.join(); t2.join(); } }</pre>
-----------	---

```
public static class PC {

    LinkedList<Integer> list = new LinkedList<>();
    int capacity = 2;

    public void produce() throws InterruptedException {
        int value = 0;
        while (true) {
            synchronized (this) {

                while (list.size() == capacity)
                    wait();

                System.out.println("Producer produced-"
                    + value);

                list.add(value++);

                notify();

                Thread.sleep(1000);
            }
        }
    }

    public void consume() throws InterruptedException {
        while (true) {
            synchronized (this) {

                while (list.size() == 0)
                    wait();

                int val = list.removeFirst();

                System.out.println("Consumer consumed-"
                    + val);

                notify();
            }
        }
    }
}
```

```

        Thread.sleep(1000);
    }
}
}
}
this.count=count;
}

public void run() {

    for(int i=1;primeCount<count;i++){
        boolean isPrime=true;
        if(i==1)

System.out.println("\n-----");
System.out.println("\nApple is in the List- "+
fruits.contains("Durian"));
System.out.println("Strawberry is in the List-
"+fruits.contains("Strawberry"));

//Size of the ArrayList

System.out.println("\n-----");
System.out.println("\nSIZE OF THE ARRAYLIST: "+ fruits.size());

```

```

//returns the object of list which is present at the specified index
System.out.println("\n-----");
System.out.println("\n\nOBJECT AT INDEX 2: "+ fruits.get(2));

// removing all the elements of the ArrayList

fruits.clear();

System.out.println("\n\nARRAYLIST AFTER Clear(): "+ fruits);
    }
}

```

RESULT: The above program is executed and obtained the output.

OUTPUT :

ORIGINAL LIST:

Pomegranate Lemon Avocado Orange Durian Watermelon

ARRAYLIST AFTER REMOVAL OF ELEMENTS:

Pomegranate Lemon Durian Watermelon

ARRAYLIST AFTER UPDATION:

Pomegranate Lemon Durian Guava

ARRAYLIST AFTER SORTING:

Durian Guava Lemon Pomegranate

Apple is in the List- true

Strawberry is in the List- false

SIZE OF THE ARRAYLIST: 4

OBJECT AT INDEX 2: Lemon

ARRAYLIST AFTER Clear(): []

Process finished with exit code 0

PROGRAM NO : 27

AIM: Program to remove all the elements from a linked list

ALGORITHM :

Step 1: Start

Step 2: Declare a 2 D array named str of type String and read values into it.

Step 3: Create an object student of type LinkedList and put values in str into stud using add()

Step 4: Traverse through stud using Iterator and print the values.

Step 5: Stop.

PROGRAM CODE:

Main.java	<pre> import java.util.*; public class Main { public static void main(String[] args) { int n; String data; LinkedList<String> linkedList = new LinkedList<String>(); System.out.println("Enter number of strings to be inserted : "); Scanner scanner = new Scanner(System.in); n = scanner.nextInt(); System.out.println("Enter the string(s) : "); scanner.nextLine(); for (int i = 0; i < n; i++) { data = scanner.nextLine(); linkedList.add(data); } System.out.println("LinkedList: " + linkedList); System.out.println("Removing all the elements...."); linkedList.clear(); System.out.println(linkedList); } } </pre>
-----------	---

RESULT: The above program is executed and obtained the output.

OUTPUT :

```
C:\Users\Razik\.jdk\corretto-1.8.0_302\bin\java.exe ...
Enter number of strings to be inserted :
4
Enter the string(s) :
jabulani
Teamgeist
Telstar
Ferenova
LinkedList: [jabulani, Teamgeist, Telstar, Ferenova]
Removing all the elements....
[]

Process finished with exit code 0

        g.fillOval(25,25,10,10);  
        g.fillOval(75,25,10,10);  
        g.setColor(Color.black);  
        g.drawArc(25,35,50,50,0,180);  
  
    }  
}  
}
```

RESULT: The above program is executed and obtained the output.

OUTPUT:

The image displays two screenshots of a Java applet window titled "Applet".

Top Screenshot (Happy Face): The applet shows a yellow smiley face on the left. On the right, there are five input fields labeled "MARK 1:" through "MARK 5:" with values 40, 50, 90, 80, and 60 respectively. Below these is a "PERCENTAGE:" field with the value 64.0. At the bottom right is a button labeled "SEE STATUS".

MARK	Value
MARK 1:	40
MARK 2:	50
MARK 3:	90
MARK 4:	80
MARK 5:	60
PERCENTAGE:	64.0

Bottom Screenshot (Sad Face): The applet shows a yellow frowny face on the left. On the right, the input fields are labeled "MARK 1:" through "MARK 5:" with values 40, 50, 0, 0, and 0 respectively. The "PERCENTAGE:" field shows the value 18.0. The "SEE STATUS" button is at the bottom right.

MARK	Value
MARK 1:	40
MARK 2:	50
MARK 3:	0
MARK 4:	0
MARK 5:	0
PERCENTAGE:	18.0

PROGRAM NO : 38

AIM: Using 2D graphics commands in an Applet, construct a house. On mouse click event, change the color of the door from blue to red.

ALGORITHM:

Step.1: Start the program.

Step.2: Define a class 'House' that extends Applet and implements MouseListener.

Step.3: Define methods to add MouseListener to the panel.

Step.4: Using getX() and getY() methods, get the coordinates of the door to repaint when the MousePressed event occurs.

Step.5: Stop the program.

PROGRAM CODE:

House.java	<pre> import java.awt.*; import java.applet.*; import java.awt.event.*; public class House extends Applet implements MouseListener { int a,b; public void init() { addMouseListener(this); } public void paint(Graphics g) { int x[]={ 150,300,225 }; int y[]={ 150,150,25 }; g.drawPolygon(x,y,3); g.setColor(Color.GRAY); g.fillPolygon(x,y,3); g.drawRect(150,150,150,200);//House g.setColor(Color.CYAN); </pre>
------------	---

```
g.fillRect(150,150,150,200);

g.drawRect(200,200,50,150); //Door
g.setColor(Color.blue);
g.fillRect(200,200,50,150);

if(a>200 && a<300 && b>200 && b<300)
{
    g.setColor(Color.red);
    g.fillRect(200, 200, 50, 150);
}
}
public void mouseClicked(MouseEvent e)
{

}
public void mouseEntered(MouseEvent e)
{

}

@Override
public void mouseExited(MouseEvent e) {

}

public void mousePressed(MouseEvent e)
{
    a=e.getX();
    b=e.getY();
    repaint();

}
public void mouseReleased(MouseEvent e)
{

}

}
```

RESULT: The above program is executed and obtained the output.

OUTPUT:

PROGRAM NO : 39

AIM: To implement a simple calculator using AWT components.

ALGORITHM:

Step.1: Start the program.

Step.2: Define a class 'calculator' that extends Frame and implements ActionListener interface.

Step.3: Using TextField class object, construct the required no. of textfields wide enough to hold the values entered by the user.

Step.4: Using Label class object, construct and provide the appropriate labels.

Step.5: Using Button class object, construct labeled buttons that send the instances of ActionEvent.

Step.6: Call addActionListener() method to send events from the button to the new listener.

Step.7: Get the string values from textfields and then parse them as integers.

Step.8: Perform various methods to add, subtract, multiply and divide those integers.

Step.9: Stop the program.

PROGRAM CODE:

MyCalculator.java	<pre> import java.awt.*; import java.applet.*; import java.awt.event.*; public class MyCalculator extends Applet implements ActionListener { TextField inp; public void init() { setBackground(Color.white); setLayout(null); int i; inp = new TextField(); inp.setBounds(150,100,270,50); </pre>
-------------------	---

```

this.add(inp);

RESULT: The above program is executed and obtained the output.

OUTPUT:

Applet started.

PROGRAM NO : 40

AIM: To develop a program that has a Choice component which contains the names of shapes such as rectangle, triangle, square and circle. Draw the corresponding shapes for given parameters as per user's choice.

ALGORITHM:

Step.1: Start the program.

Step.2: Define a class 'shapes' that extends Applet class and implements ItemListener interface.

Step.3: Declare a new constructor of the Choice class to create an empty Choice menu.

Step.4: Use add() method to include items in the menu.

Step.5: Using getSelectedItem() method, get the item chosen by the user and repaint accordingly.

Step.6: Stop the program.

PROGRAM CODE:

Main.java	<pre> import java.applet.*; import java.awt.*; import java.awt.Graphics; import java.awt.event.*; public class Main extends Applet implements ItemListener { Choice figure = new Choice(); int Select; public void init() { figure.addItem("Select your choice"); figure.addItem("Rectangle"); figure.addItem("Square"); figure.addItem("Circle"); figure.addItem("Triangle"); add(figure); figure.addItemListener(this); </pre>
-----------	---

	<pre> } public void itemStateChanged (ItemEvent e) { Select = figure.getSelectedIndex(); repaint(); } public void paint(Graphics g) { g.setColor(Color.red); super.paint(g); if (Select == 1) { g.drawRect(280, 100, 160,40); } if (Select == 2) { g.drawRect(50,50,100,100); } if (Select == 3) { g.drawOval(150,150,100,100); } if (Select ==4) { g.drawLine(120, 130, 280, 130); g.drawLine(120, 130, 200, 65); g.drawLine(200, 65, 280, 130); } } } </pre>
index.html	<pre> <html> <body> <applet code="Main.class" width="600" height="600"> </applet> </body> </html> </pre>

RESULT: The above program is executed and obtained the output.

OUTPUT:

PROGRAM NO : 41

AIM: To develop a program to handle all mouse events and window events.

ALGORITHM:

Step 1: Start.

Step.1: Start the program.

Step.2: Define a class MouseDemo that extends Applet class and implements MouseListener interface.

Step.3: Define methods to add MouseListener to the panel which will have the following methods:

- void mouseClicked(MouseEvent me) - Invoked when the mouse has been clicked.
- void mousePressed(MouseEvent me) - Invoked when the mouse has been pressed.
- void mouseReleased(MouseEvent me) - Invoked when the mouse has been released.
- void mouseEntered(MouseEvent me) - Invoked when the mouse has entered the panel.
- void mouseExited(MouseEvent me) - Invoked when the mouse has exited the panel.
- void mouseDragged(MouseEvent me) - Invoked when the mouse has been dragged.

Step.4: Using getX() and getY() methods, get the location (or movements) of mouse pointer on the panel. Use them to display the necessary message in the output.

Step.5: Define another class WindowEvents that extends Applet class and implements WindowListener interface.

Step.6: Define methods to add WindowListener to the panel which will have the following methods:

- void windowActivated(WindowEvent arg0) - Invoked when the window has been activated.
- void windowOpened(WindowEvent arg0) - Invoked when the window has been Opened.
- void windowDeactivated(WindowEvent arg0) - Invoked when the window has been deactivated.
- void windowIconified(WindowEvent arg0) - Invoked when the window has been iconified.
- void windowDeiconified(WindowEvent arg0) - Invoked when the window has been deiconified
- void windowClosed(WindowEvent arg0) - Invoked when the window has been closed.

Step.7: Display the appropriate message in the output.

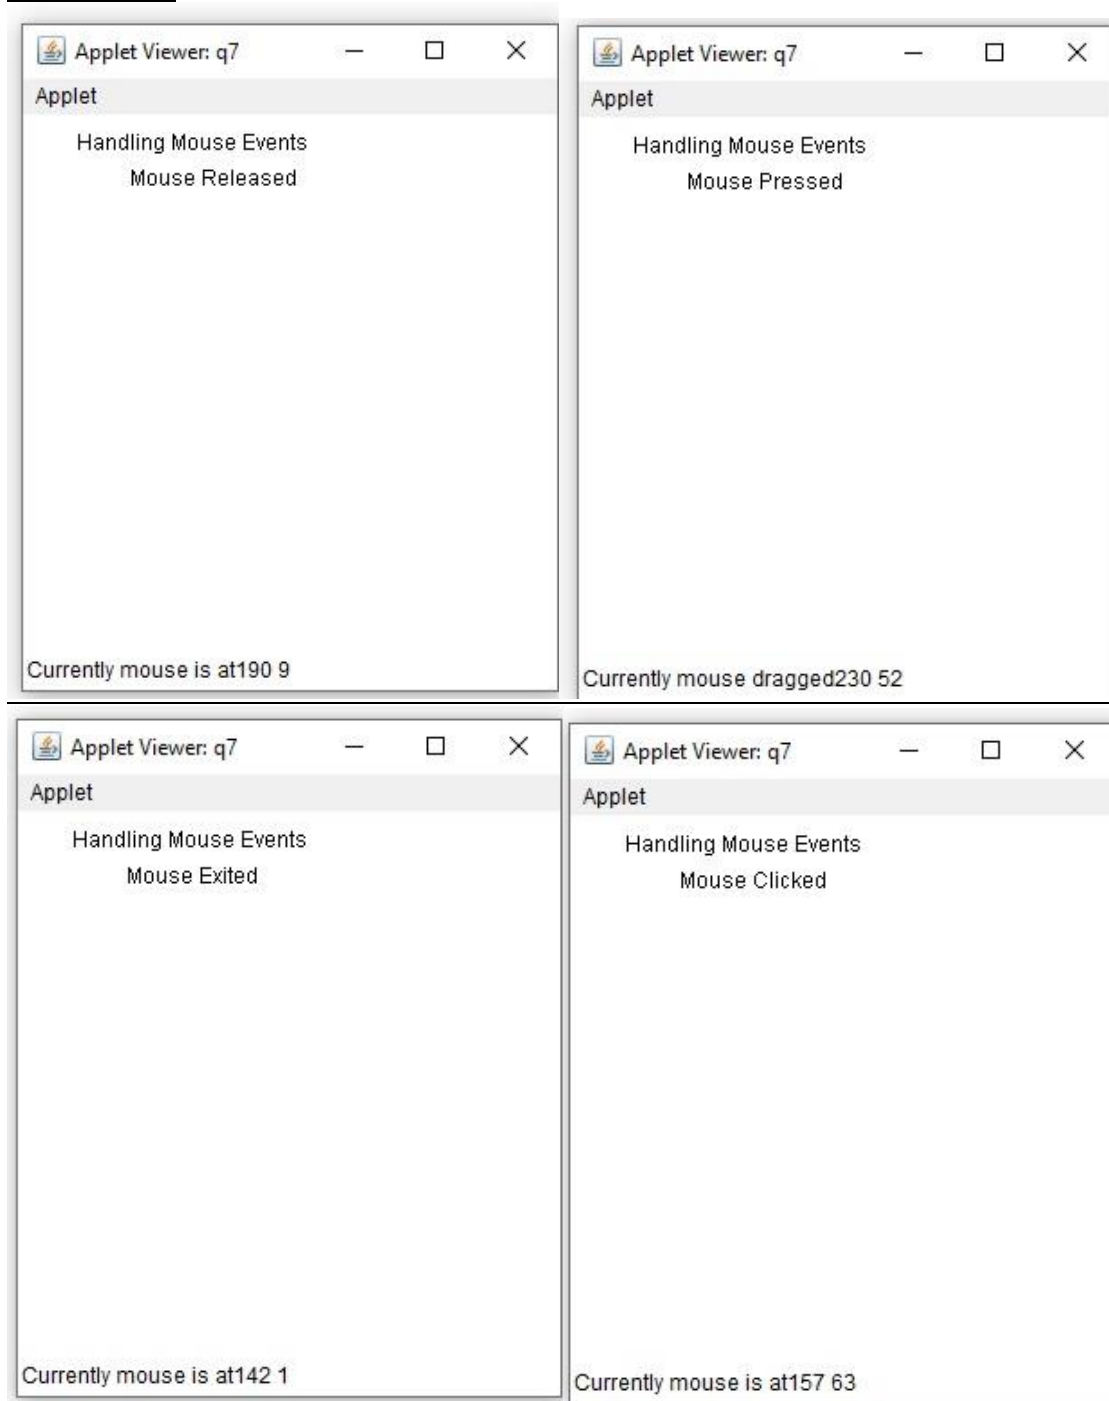

Step.8: Stop the program.

PROGRAM CODE:

Main.java	<pre> import java.awt.*; import java.applet.*; import java.awt.event.*; public class Main extends Applet implements MouseListener,MouseMotionListener { int mx=0; int my=0; String msg=""; public void init() { addMouseListener(this); addMouseMotionListener(this); } public void mouseClicked(MouseEvent me) { mx=20; my=40; msg="Mouse Clicked"; repaint(); } public void mousePressed(MouseEvent me) { mx=30; my=60; msg="Mouse Pressed"; repaint(); } public void mouseReleased(MouseEvent me) { mx=30; my=60; msg="Mouse Released"; repaint(); } public void mouseEntered(MouseEvent me) </pre>
-----------	--

	<pre> { mx=40; my=80; msg="Mouse Entered"; repaint(); } public void mouseExited(MouseEvent me) { mx=40; my=80; msg="Mouse Exited"; repaint(); } public void mouseDragged(MouseEvent me) { mx=me.getX(); my=me.getY(); showStatus("Currently mouse dragged"+mx+" "+my); repaint(); } public void mouseMoved(MouseEvent me) { mx=me.getX(); my=me.getY(); showStatus("Currently mouse is at"+mx+" "+my); repaint(); } public void paint(Graphics g) { g.drawString("Handling Mouse Events",30,20); g.drawString(msg,60,40); } } </pre>
index.html	<pre> <html> <body> <applet code="Main.class" width="600" height="600"> </applet> </body> </html> </pre>

RESULT: The above program is executed and obtained the output.

OUTPUT:

PROGRAM NO : 42

AIM: To develop a program to handle Key events.

ALGORITHM:

Step.1: Start the program.

Step.2: Define a class keys that extends Applet and implements KeyListener.

Step.3: Define methods to add KeyListener to the panel which will have the following methods:

- void keyTyped(KeyEvent e) – Invoked when a key has been typed.
- void keyPressed(KeyEvent e) - Invoked when a key has been pressed.
- void keyReleased(KeyEvent e) - Invoked when a key has been released.

Step.4: Using getKeyChar(), get the unicode and character representation of the key pressed. Use them to display the necessary message in the output.

Step.5: Stop the program.

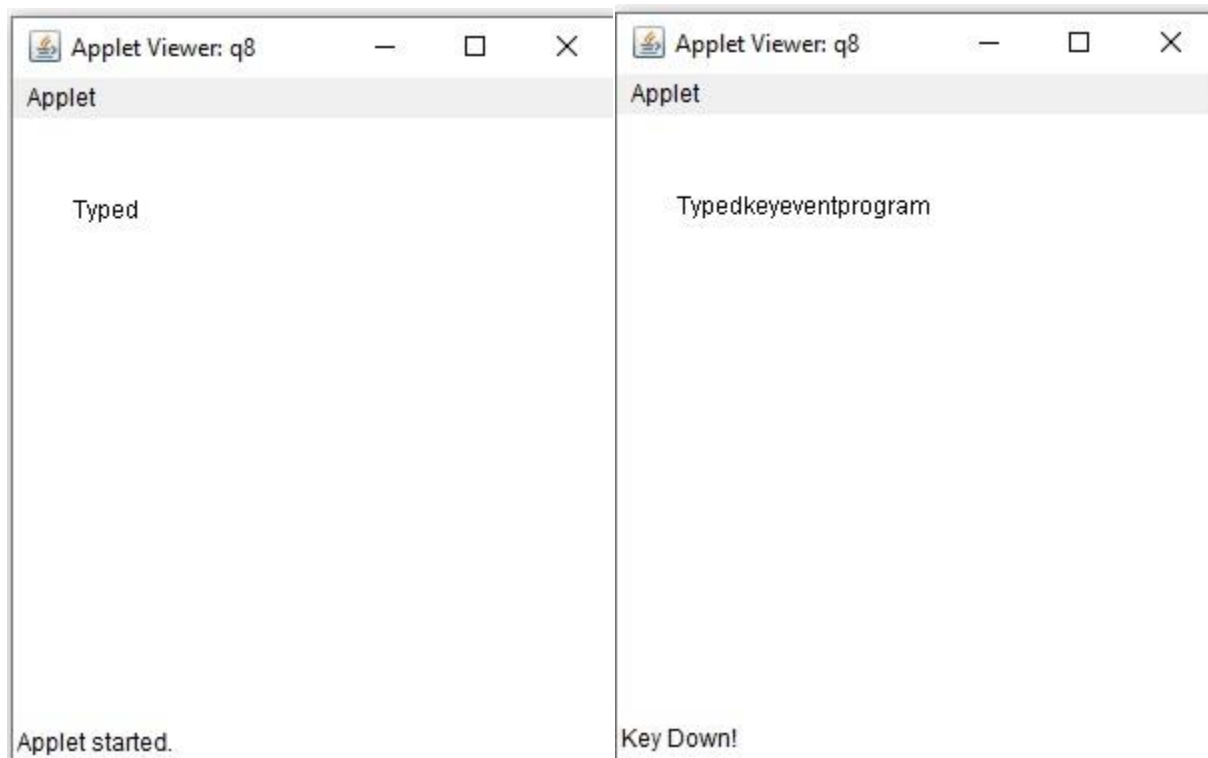

PROGRAM CODE:

Main.java	<pre> import java.awt.*; import java.awt.event.*; import java.applet.*; public class Main extends Applet implements KeyListener { String msg="Typed"; int x=30,y=50; public void init() { addKeyListener(this); requestFocus(); } public void keyTyped(KeyEvent ke) { msg+=ke.getKeyChar(); repaint(); } public void keyReleased(KeyEvent ke) </pre>
-----------	---

	<pre>{ showStatus("Key Up!"); } public void keyPressed(KeyEvent ke) { showStatus("Key Down!"); } public void paint(Graphics G) { G.drawString(msg,x,y); } }</pre>
--	---

RESULT: The above program is executed and obtained the output.

OUTPUT:

PROGRAM NO : 43

AIM: To write program to list the sub directories and files in a given directory and also search for a file name.

ALGORITHM:

Step.1: Start the program.

Step.2: Create a class named 'FilesList' that implements FilenameFilter interface.

Step.3: Create an object for the class File to initialize its constructor with the file source.

Step.4: Using list(), get the names of all the files present in the directory.

Step.5: Create an object for the FileNameFilter interface that contains the method Boolean accept (File dir, String name) to test if a specified file should be included in the file list or not. .

Step.6: Filter accordingly and store the file names to the list.

Step.7: Display the list.

Step.8: Stop the program.

PROGRAM CODE:

Main.java	<pre> import java.io.*; public class Main { public static void main(String[] args) { File file = new File("../..../"); String[] fileList = file.list(); for(String str : fileList) { System.out.println(str); } } </pre>
-----------	--

	<pre> FilenameFilter filter = new FilenameFilter() { public boolean accept (File dir, String name) { return name.startsWith("A"); } }; System.out.println("\n"); String[] children = file.list(filter); if (children == null) { System.out.println("Either dir does not exist or is not a directory"); } else { for (int i = 0; i < children.length; i++) { String filename = children[i]; System.out.println(filename); } } } </pre>
--	---

RESULT: The above program is executed and obtained the output.

PROGRAM NO : 47

AIM: To implement client server communication using Socket – TCP/IP.

ALGORITHM:

Step.1: Start the program.

Step.2: To create the Client application, create an instance of ClientSocket class.

- 2.1 : Initiate connection to the server using hostname and a port number.
- 2.2 : Send data to the server using an OutputStream object.
- 2.3 : Read data from the server using an InputStream object.
- 2.4 : Close the connection.

Step.3: To create the Server application, create an instance of ServerSocket class.

- 3.1 : Wait till a connection is established. Socket s = ss.accept();
- 3.2 : Receive data from the client using an InputStream object.
- 3.3 : Send data to the client using an OutputStream object.
- 3.4 : Close the connection.

Step.4: Stop the program.

PROGRAM CODE:

Client.java	<pre> import java.io.*; import java.net.*; public class Client { public static void main(String[] args) { try{ Socket socket=new Socket("localhost",7011); DataOutputStream dout=new DataOutputStream(socket.getOutputStream()); dout.writeUTF("Client Call!!!"); dout.flush(); dout.close(); socket.close(); }catch(Exception e){System.out.println(e);} } } </pre>
Server.java	<pre> import java.io.*; import java.net.*; public class Server { public static void main(String[] args){ try{ ServerSocket serverSocket=new ServerSocket(7011); Socket socket=serverSocket.accept(); //establishes connection DataInputStream dis=new DataInputStream(socket.getInputStream()); String str=(String)dis.readUTF(); System.out.println("message= "+str); serverSocket.close(); } catch(Exception e){ System.out.println(e); } } } </pre>

RESULT: The above program is executed and obtained the output.

OUTPUT:

```
Run: Server x Client x
C:\Users\Razik\.jdk\corretto-1.8.0_302\bin\java.exe ...
message= Client Call!!!
Process finished with exit code 0
```

PROGRAM NO : 48

AIM: Client Server communication using DatagramSocket - UDP

ALGORITHM:

Step.1: Start the program.

Step.2: Create the Client application:

2.1 : Create a DatagramSocket object to carry the packet to the destination and to receive it whenever the server sends any data.

2.2 : Create the packet for sending/receiving data via a DatagramSocket.

DatagramPacket(byte buf[], int length, InetAddress inetaddress, int port):-

2.3 : Invoke a send() or receive() call on socket object.

2.4 : Close the connection.

Step.3: Create the Server application:

3.1 : Create a DatagramSocket object to listen at the port specified.

3.2 : Create the packet for sending/receiving data via a DatagramSocket.

3.3 : Invoke a send() or receive() call on socket object.

3.4 : Close the connection.

Step.4: Stop the program.

PROGRAM CODE:

Client.java	<pre> import java.io.*; import java.net.*; public class Client { public static void main(String[] args) throws IOException { DatagramSocket client= new DatagramSocket(); InetAddress add=InetAddress.getByName("localhost"); String str ="Ping from Client!!!"; byte[] bufBytes = str.getBytes(); DatagramPacket datagramPacket=new DatagramPacket(bufBytes,bufBytes.length,add,4220); client.send(datagramPacket); client.close(); } } </pre>
Server.java	<pre> import java.io.*; import java.net.*; public class Server { public static void main(String[] args) throws IOException { DatagramSocket server=new DatagramSocket(4220); byte[] buf=new byte[256]; DatagramPacket packet=new DatagramPacket(buf,buf.length); server.receive(packet); String response =new String(packet.getData()); System.out.println(" Server : "+response); server.close(); } } </pre>

RESULT: The above program is executed and obtained the output.

OUTPUT:

```

Run:  Server (1) x  Client (1) x
